

## Covid-19 Antigen Testing

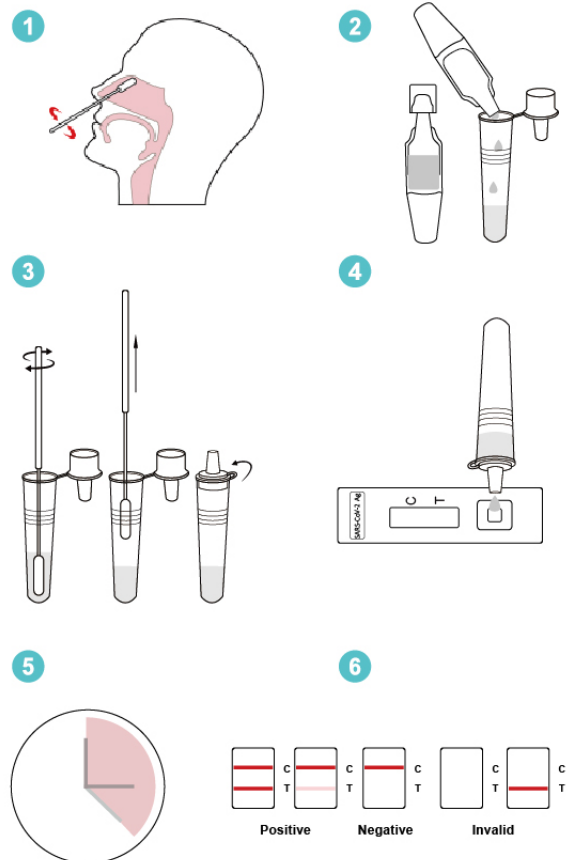

There are many testing options out there today, but none that can give you results on active infection as quickly as an antigen test.

With each of the many types of tests available, it is important to be aware that they have various levels of accuracy, and each serve a unique purpose within the diagnostic pathway for confirming exposure and diagnosis.

Antigen testing is a great and quick solution for employer and at-home use. Antigen tests determine if fragments of viral Covid-19 are currently present within an individual, which may indicate an active infection.

### Antigen Testing Benefits:

- It can be used quickly to determine active infection (10-15 minutes)
- Inexpensive, and readily available
- Great for weekly testing
- Can detect as early as day 5 from exposure
- Not as invasive as PCR collection
- Acceptable for compliance testing per OSHA and other mandatory testing requirements
- Comes in a Ready-to-Use Kit

Keep your employees working, remain compliant, and do it all with  
little to no downtime!
